

Class Diagram

Scenario

You are hired to build a simple payroll module for a startup. The company employs three types of workers:

1. Full-Time Employees → Paid a base salary + fixed bonus
2. Part-Time Employees → Paid hourly rate × hours worked
3. Contractors → Paid daily rate × days worked

All workers share common identification data, but their salary calculation and info formatting differ. Your task is to model this using inheritance and demonstrate polymorphic behavior.
